U.S. Patent and Trademark Office PTOL-303 (Rev. 7-05)

Continuation of 11. does NOT place the application in condition for allowance because: Applicant is again arguing that an advantage that would necessarily exist is somehow patentable. The cited prior art makes obvious chromate-free coatings with fasteners. Applicant did not invent the coating, but wants exclusive rights to use the coating with particular existing fasteners, based on the fact that the coated fastener "performs better" than one coated with a chromate-containing fluoropolymer in a prevailing torque test using tangless inserts. Applicant is now arguing that this comparison indicates some patentable structure. Even if examiner accepted that argument, applicant never defines "better" - better to whom? Better how? How would one of ordinary skill in the art know the metes and bounds of "a prevailing torque test"? However, examiner does not accept the argument, as a fastener coated with XYLAN® 5230, per the teaching of the Whitford paper, will necessarily have the same structure, and thus the same properties, and these properties will necessarily include the same performance in a torque test. EVEN IF it were completely unexpected that the torque test results were as claimed, it would not matter, the Lutkus in view of Whitford fastener would nece3ssarily perform the same since it is the same structure and same coating.
